FS Example. Fig 1. 18pp; Endish.

Example: Fig 1. 18pp; Endish.

Example: Fig 1. 18pp; Endish.

CC labelled nt analogues to prevent migration in electrophoretic labelled nt analogues to prevent migration in electrophoretic condification involves the use of a phosphatase enzyme to remove at modification involves the use of a phosphatase enzyme to remove at condification involves the use of a phosphatase enzyme to remove at conditionating kt. The template used was I microg. of M13 mp8. The configuration involves and phosphatase digestion. This confludes T04866. T04867 was a control nt. which was not treated with includes T04866. T04867 was a control nt. which was not treated with conditional phosphatase. The example shows that alkaline phosphatase control nt. which was not treated with the new part of the dye-terminator attefacts and allows for accurate base calling with the ABI analysis software.

New isolated Treponema pallidum nucleic acids - used to develop new isolated Treponema pallidum intections, characterisation, prevention products for the detection diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis Claim 1; Page 257; 1150pp; English.

X20500-2143 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrella infections in animals, and for the production of biosynthetic products such as enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           46 GIGGAICCCCCGGGCIGCAGGAAIICGAIAICAAGCIIAICGAIACCGICGACCICGAGG 105

Page 30-31; 74pp; English.

Human endogenous retroviral sequences 10, 11-29, 3, 6, 12, 13, 14 and 11-22 (T75003-10) were obtd. by screening human genomic libraries using human breast tumour-associated retroviral element B18Ag1 (see also T75002) as probe. These non-contiguous sequences lie in order 11-22, 14, B18Ag-1, 13, 12, 10, 3, 11-29, 6 in the retrovirus sequences can be used in genetic vaccines and for the prognosis, diagnosis and monitoring of human breast cancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Plasmid pd-host6 containing Ts replication system.

Temperature sensitive replication; antibiotic resistance marker gensite-specific recombination; chromosomal integration; inactivation; beterologus gene expression; thermosensitive plasmid; ds.

Synthetic
site, T7 and T3 promoters and sequencing primer binding sites. The resulting plasmid was designated pVE6004 (or pG+host4 - 046463).
To facilitate cloning in B.coli, the 1.4kb Avai-AlwNI fragment of pBR322 (containing the origin of replication) was inserted into Nsir-cleaved pG+host4 to give pG+host5 (048464). The pBR322 ORI allows maintenance of the plasmid in E.coli at 37 deg.C. while the heat-sensitive ORI allows maintenance at 28 deg.C in gram-positive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

This is the nucleotide sequence of a clone of the fluory2 (fl2)

This is the nucleotide sequence of a 24-kDa alpha-zein protein (see W23977) that includes a 21-waino acid signal peptide (see W23976)
which targets the alpha-zein to the lumen of the rough endoplasmic reticulum. A claimed cereal plant contains a transgene comprising a first polynucleotide that encodes the fl2 signal peptide and a second polynucleotide that encodes an agronomically high-value contein. Also new are seeds produced by the plants, the transgene itself, and a transgene that also includes the fl2 promoter. The second polynucleotide preferably encodes a protein that has a high content of Mat, is, Try and/or Thr so that feeds from transformed maize, wheat, rice, barley, millet or sorghum will have increased contents of these essential amino acids in their seeds (all

This is the nucleotide sequence of Swedish-FAD APP targetting
This is the nucleotide sequence of Swedish-FAD APP targetting
This is the nucleotide sequence of Swedish-FAD APP targetting
strategy that facilitates the introduction of one or more specific
mutations into any gene in a single double reciprocal homologous
cecombination step. The method has been used particularly for
introducing a humanised amyloid precursor protein (APP) gene into
codents for producing animal models of Alzheimer's disease (AD).

Independent lines of transgenic mice (lines ESSOO7, ESSIO3,
Todents for producing animal models of Alzheimer's disease (AD).

Independent lines of transgenic mice (lines ESSOO7, ESSIO3,
Todents and ESSAO1) have been created using the gene targetting
technique applied to embryonic stem cells. In each line, the mouse
APP gene was modified to encode a mouse/human hybrid (m/hAPP) where
amino acid residues 666-770 of APP770 were encoded by human cDNA
sequences instead of mouse genomic exons (exons 16-18). Within
these residues, only a amino acid differences exist between the
mouse and human proteins, i.e. Gly-676 to Arg, Phe-681 to Thr and
Arg-684 to His. The exon-cDNA fusion gene therefore encodes an APP
containing a humanised beta-amyloid domain. In line ESSOO7,
Created using vector pMTI-2398, the Swedish mutation. i.e.

KW(670,681) ML, was also introduced. The targetted Swedish FAD

M/hAPP gene expressed m/hAPP in brain.

This is the nucleotide sequence of London-FAD APP targetting vector pMTI-2453. The invention provides a novel gene targetting vector pMTI-2453. The invention provides a novel gene targetting conditions into any gene in a single double reciprocal homologous mutations into any gene in a single double reciprocal homologous recombination step. The method has been used particularly for recombination step. The method has been used particularly for redents for producing animal models of Alzheimer's disease (AD).

Introducing a humanised amyloid precursor protein (APP) gene into created using the gene targetting s55401 and ES5403 have been created using the gene targetting technique applied to embryonic stem cells. In each line, the mouse technique applied to embryonic stem cells.

ESS401 and ES5403) have been created using the gene targetting (m/hAPP) where amino acid residues 666-770 of APP770 were encoded by human cDNA sequences instead of mouse genomic exons (exons 16-18). Within these residues, only 3 amino acid differences exist between the mouse and human proteins, i.e. Gly-676 to Arg, Phe-681 to Thr and targetting a humanised beta-amyloid domain. In line ES5401, created using vector pWTI-2453, the London mutation i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Qy 46 GIGGATCCCCGGGCTGCAGGAATTCGATATCAAGCTTATCGATACCGTCGACCTCGAGG 105

This is the nucleotide sequence of Swedish/London-FAD APP targetting vector part-245. The invention provides a novel gene targetting strategy that facilitates the introduction of one or more specific mutations into any gene in a single double reciprocal homologous completely for introducing a humanised amyloid precursor protein (APP) gene into introducing a humanised amyloid precursor protein (APP) gene into introducing a humanised amyloid precursor protein (APP) gene into codents for producing animal models of Alzheimer's disease (AD).

Introducing a humanised amyloid stem cells. In each line, the mouse ES5401 and ES5403) have been created using the gene targetting technique applied to embryonic stem cells. In each line, the mouse canno acid residues fof-770 of APP770 were encoded by human cDNA sequences instead of mouse genomic exons (exons 16-18). Within these residues, only 3 mino acid differences exist between the mouse and human proteins, i.e. Gly-675 to Arg. Phe-681 to Thr and Arg-684 to His. The exon-CDNA fusion gene therefore encodes an APP containing a humanised beta-amyloid domain. In line ESS103, and the Swedish mutation. i.e. KW(670,671)ki, and the Swedish mutation. However here introduced. The targetted Swedish/London mutation. i.e. knowned in the appeted Swedish/London PADD MADP gene expressed introduced. The targetted Swedish/London PADD MADP gene expressed introduced. The targetted Swedish/London PADD MADP gene expressed introduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             46 GIGGAICCCCCGGGCIGCAGGAATICGATAICAAGCITAICGAIACCGICGACCICGAGG 105

This is the nucleotide sequence of Swedish-FAD APP713 targetting vector part-255. The invention provides a novel gene targetting strategy that facilitates the introduction of one or more specific mutations into any gene in a single double reciprocal homologous crecombination step. The method has been used particularly for introducing a humanised amyloid precursor protein (APP) gene into introducing a humanised amyloid precursor protein (APP) gene into rodents for producing animal models of Alzheimer's disease (AD).

Introducing a humanised anyloid precursor protein (APP) gene into rodents for producing animal models of Alzheimer's disease (AD).

ES5401 and ES5403) have been created using the gene targetting technique applied to embryonic stem cells. In each line, the mouse targetting to embryonic stem cells. In each line, the mouse candified to encoded a mouse/human pybrid (m/hAPP) where amyloid sesidues (66-770 of APP770 were encoded by human cDNA sequences instead of mouse genomic exons (exons 16-18). Within the mouse and human proteins, i.e. cly-676 to Arg, Phe-681 to The and Arg-684 to His. The exon-cDNA fusion gene therefore encodes an APP containing a humanised beta-amyloid domain. In line ES5215, created using vector pMTI-2455, the Swedish mutation. i.e. (RM(670,681)RL, was also introduced, and also a stop codon (T to sequence in the prosition of the containing and t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Wirak DO;

Sequence 1, Application US/08992334

Patent No. 5919678

GENERAL INFORMATION:
APPLICANT: Gruss, Alexandra
APPLICANT: Gruss, Emmanuelle
APPLICANT: Maguin, Emmanuelle
TITLE OF INVENTION: METHODS FOR USING A TEMPERATURE-SENSITIVE
TITLE OF INVENTION: PLASMID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        47.0%; Score 68.2; DB 4; Length 793; 85.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                COUNTRY: USA
ZIP: 98101-2347
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/870,693
                  SEQUENCE CHARACTERISTICS:
LENGTH: 2150 base pairs
TYPE: nucleic acid
STRANDEDNESS: single
TOPOLOGY: linear
MOLECULE TYPE: cDNA to mRNA
DESCRIPTION: yeast RAD17 cDNA
HYPOTHETICAL: NO
ARGINAL SOURCE:
ORGANISM: Saccharomyces cerevisiae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CLASSIFICATION: 536

Title:

```
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score Match Length DB

/note="CDNAs were generated from poly (A+) enriched mRNA
prepared from different developmental stages of T.b. brucei
by reverse transcription followed by PCR amplification
using mini-exon and oligo(dT) primers. The CDNA generated
were utilized in RADES-PCR coupled with differential
hybridisations to identify differentially expressed mRNA
transcripts. The products which showed to be
differentially expressed were cloned DGEM -T vector.
These differentially expressed mRNA transcripts were (are
being) sequenced to generate differentially expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The institute for Genomic Research 9712 Medical Center Dr., Rockville, MD 20850, USA Tel: 301 838 0200

Cereal plants containing trans-gene expressing fusion that includes signal peptide of the f12 maize gene - and protein having high content of essential amino acids, producing feeds of improved nutritional value

Tutritional value

Claim 14; F1g 1A.H; 37pp; English

Claim 14; F1g 1A.H; 37pp; English

This is the nuclectide sequence of a clone of the fluory2 (f12)

Gene of maize. It codes for a 24 kDa alpha-zein protein (see W23977). that includes a 21-amino acid signal peptide (see W23976)

W150 frargets the alpha-zein to the lumen of the rough endoplasmic reticulum. A claimed cereal plant contains a transgene comprising a first polynucleotide that encodes the f12 signal peptide and a second polynucleotide that encodes an agronomically high-value protein. Also new are seeds produced by the plants, the transgene treath also includes the f12 promoter. The second polynucleotide preferably encodes a protein that has a high content of Met, Lys, Trp and/or Thr so that feeds from transformed maize, wheat, rice, barley, millet or sorghum will have increased contents of these essential amino acids in their seeds (all Ë 2262 G; 2484 C; 22-JAN-1998. 11-JUL-1997; U11723. 17-JUL-1996; US-021833. Rever Majoration of residual fluorescence labelled nucleotide analogues - to prevent migration in electrophoretic sequencing gel and interference with base calling of DNA chains.

Example; Fig 1; 18pp; English.

C The invention concerns the modification of redisual fluorescence of the invention concerns the modification in electrophoretic labelled nt analogues to prevent migration in electrophoretic condification involves the use of a phosphatase enzyme to remove at modification involves the use of a phosphatase enzyme to remove at last one 5'-phosphate gp. The nts were prepared using ABI Amplitage conditions in The remplate used was 1 microg. of M13 mp8. The primer was M13 Universal primer. Samples were recovered. Some were conjected to calf intestinal alkaline phosphatase digestion. This includes 704866. To 4867 was a control nt. Which was not treated with a labiline phosphatase. The example shows that alkaline phosphatase calling with the ABI analysis software.

C treatment causes removal of the dye-terminator artefacts and allows for a courate base calling with the ABI analysis software.

C Human endogenous retroviral sequences 10, 11-29, 3, 6, 12, 13, 14

Human endogenous retroviral sequences tumour-associated retroviral element of 11-22 (775003-10) were obtd. by screening human genomic and 11-22 (775003-10) were obtd. These non-contiguous sequences in 11-22, 14, B18Ag-1, 13, 12, 10, 3, 11-29, 6 in the retrovirus genome (see also 775001). B18Ag1 and the other retroviral sequences can be used in genetic vaccines and for the prognosis, diagnosis and monitoring of human breast cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        especially breast cancer claim monitoring of human cancers, especially breast cancer claim 10; Page 30-31; 74pp; English.

Claim 10; Page 30-31; 74pp; English.

Human endogenous retroviral sequences 10, 11-29, 3, 6, 12, 13, 14 and 11-22 (775003-10) were obtd. by screening human genomic libraries using human breast tumour-associated retroviral element 118 and 11-22, 14, 1818Ag-1, 13, 12, 10, 3, 11-29, 6 in the retroviral sequences can be used in genetic vaccines and for the proposals, diagnosis and monitoring of human breast cancer. Sequence 1122 Bp; 260 A; 316 C; 185 G; 279 T;
                                                                                                                                                                                                                                                                      numman enaogenous retroviral sequence 3.
